Assignment statement

```
ASSIGN_STMT : IDENTIFIER "=" EXPR ";"
```

An *assignment statement* moves a value into the specified target.

An assignment statement consists of an expression identifier, *the assignee operand,* followed by an equals sign (=) and a value expression, the assigned value operand. The assignee operand must be a visible local identifier, and the value expression must be of the same type.

The definition of the operand remains the original one, but with a new value.
